# Max Kramer

I affirm that I have adhered to the honor code on this assignment

*Hello again, scientist! I'll do all my writing in italics, and problems for you will be in **bold**. Comment your code, and explain your ideas in plaintext. As a general rule, I expect you to do at least as much writing as I do. Code should be part of your solution, but I expect variables to be clear and explanation to involve complete sentences. Cite your sources; if you work with someone in the class on a problem, that's an extremely important source. Don't work alone.*

## Problem 12.3.

*Reread Lay p.342, "An Orthogonal Projection."*

```
C = csvread("corkscrew.csv");  
scatter3(C(1,:),C(2,:),C(3,:));
```

We can look at this picture from different angles too!

```
view([45 45])
```

```
view([0 0])  
hold off;
```

```
v1 = [0;0;1]; v2 = [0;1;1]; v3=[1;1;-1];
```

Projection matrices are really cool! Let's see what they look like. **Let Projv1 be the matrix that projects a point onto Span(v1), Projv2 be the matrix that projects onto Span(v2), and Projv3 be the matrix that projects onto Span(v3). Show me C, Projv1\*C, Projv2\*C, and Projv3\*C on the same set of axes. If you're stuck: a linear transformation is determined by its action on the standard basis. Compute Projv1(e1), Projv1(e2), Projv1(e3). I strongly recommend Running this code (hit F5) rather than just Publishing it so you can rotate the figure by hand to see it from different angles.**

```
Projv1 = [proj(v1,[1;0;0])';proj(v1,[0;1;0])';proj(v1,[0;0;1])'];
Projv2 = [proj(v2,[1;0;0])';proj(v2,[0;1;0])';proj(v2,[0;0;1])'];
Projv3 = [proj(v3,[1;0;0])';proj(v3,[0;1;0])';proj(v3,[0;0;1])'];
```

```
C1 = Projv1 * C;
C2 = Projv2 * C;
C3 = Projv3 * C;
```

```
scatter3(C(1,:),C(2,:),C(3,:));
hold on
scatter3(C1(1,:),C1(2,:),C1(3,:));
scatter3(C2(1,:),C2(2,:),C2(3,:));
scatter3(C3(1,:),C3(2,:),C3(3,:));
```

```
Projv1 =
```

```
0    0    0
```

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$Projv2 =$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0.5000 & 0.5000 \\ 0 & 0.5000 & 0.5000 \end{bmatrix}$$

$Projv3 =$

$$\begin{bmatrix} 0.3333 & 0.3333 & -0.3333 \\ 0.3333 & 0.3333 & -0.3333 \\ -0.3333 & -0.3333 & 0.3333 \end{bmatrix}$$

I used the provided proj.m function to compute the action of each projection matrix on the standard basis for  $\mathbb{R}^3$ . The resultant matrices, Projv1, Projv2, and Projv3 were then multiplied with C to get C1, C2, and C3. I then used the scatter3() function to show each matrix on the same axes.

***Prove that v2 and v3 are orthogonal.***

`dot(v2,v3)`

`ans =`

`0`

The dot product of  $v_2$  and  $v_3$  (both in  $\mathbb{R}^3$ ) is 0. Therefore, they are orthogonal to each other.

***Reread Lay p.350. Notice that the formula in Theorem 8 is literally just the sum of the projection maps. Let  $W = \text{Span}(v_2, v_3)$ , so  $\text{Proj}W = \text{Proj}v_2 + \text{Proj}v_3$ . Plot  $C$ ,  $\text{Proj}W * C$ , and  $(\text{eye}(3) - \text{Proj}W) * C$  on the same set of axes. (I did this one in MATLAB, not quite knowing what it would look like, and said "that is the coolest shit!" aloud to nobody when I saw the answer. `view([0 0])` produces a particularly striking figure, but you should look at it from other angles too!)***
